The present sequence represents a segment of the hepatoma AS-30D Type II

chackinase promoter region. Response elements (transcription factor
binding site) in this fragment may consist of all or part of the present
sequence. AS-30D is a new isolated hexokinase II. The present DNA
cc fragment is capable of regulating transcription of a downstream open
creading frame and contains at least one response element. The present DNA
cc reading frame and contains at least one response element. The present DNA
cc fragment may be coupled to a reporter gene and used to screen for
cpotential drugs that affect regulated transcription of tumour hexokinase
cc potential drugs that affect regulated transcription of tumour hexokinase
cc II. Alternatively it may be coupled to a toxic gene and used to treat
cc lis that over-express hexokinase II, such as those present in patients
with cancer. It may also be used in gene therapy to treat diabetes. The
complete that over-express plycolysis in cells and express homologous or
cherrologous protein. Probes of the DNA fragment are used in the method
for diagnosting a neoplasia that over-expresses hexokinase. The new

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                    which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 (AAA76118-A7729) are consecutive pairs of nucleotides which contain allent SNPs. Sequences 1 to 1112 (AAA7430-A77509) are consecutive pairs of nucleotides which contain allent SNPs. Sequences 1113 to 1122 (AAA7430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AAA74430-A77509) are consecutive amino acid sequences 1113 to 1128 (AAA77430-A77450) lead to conservative amino acid changes, while those in sequences 1129 to 1186 (AAA77450-A77503) result in changes, while those in sequences 1129 to 1186 (AAA77450-A77503) result in non-conservative changes. The SNPs in sequences 1187 to 1192 (AAA77504-A77509) generate frameshift mutations. The invention also relates to a method of detecting a polymorphic site in a nucleic acid and a method of detecting polymorphic sites, antibodies raised against such peptides und a method of detecting polymorphic correspondes using the antibodies. The nucleic acids are useful for proteins/peptides using the antibodies. The nucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence of polymorphism and antibodies related administration of the wild-companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                            Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               type nucleic acid sequence. Antibodies raised against polymorphic peptides can also be used in the treatment of such individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2314 GGTCTGTGTGTGTGTGTGTGTGTGTGTGTGTGTGTGCACATCCG 2359

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats. Primers based on these sequences can be used to detect these repeats. Primers based on these sequences can be used to detect these repeats such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-76647. Those clones where the repeat sequence has been determined are shown in AAAT65704-797. This repeat sequence is from the marker clone Mdf15 which contains the repeat sequence is from
phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-777. This repeat sequence is from the marker clone MGf46 which contains the repeat sequence is from formula: (AC) 25. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZ99483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.
                                                                                                                                                                                                                                                             DNA fragmentation; microsatellite DNA; DNA marker;

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA298463-514 represent sequences from Haliotis discus, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

                                                                                                                              The specification describes a composition for assaying conformational change of a capsid protein. The composition comprises a Human farmunodeficiency virus (HIV) capsid protein which has a modification, and comprises a cavity of about 600 Angstrom cubed. The composition is useful for screening molecules that inhibit capsid carboxy terminal domain dimerisation. The composition is also useful in in vitro maturation assays, for inhibiting capsid maturation, in in vitro assembly assay, to assembly to inhibit to metate of the capsid protein, to alter the capsid protein assembly assay, to expresent an oligonucleotide used to test the inhibition of cylindrical formation of capsid and nucleocapsid proteins by compounds of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Microsatellite; ligase-assisted spacer addition assay; LASA; cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.

methods using gel electrophoresis and Southern transfer analysis. In particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to automate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to

which contain single nucleotide polymorphisms (SNPB). Sequences 1 to 1112 (AAA71318-A77429) are consecutive pairs of nucleotides which contain single nucleotide polymorphisms (SNPB). Sequences 1 to 1112 (AAA77430-A77509) are consecutive pairs of nucleotides containing SNPB which result in changes in the carresponding amino acid sequences (AAB1749-B11828). The SNPB in sequences 1113 to 1128 (AAA77430-A7746-B11828). The SNPB in conservative amino acid changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result con non-conservative changes. The SNPB in sequences 1187 to 1192 (AAA77504-A77509) generate frameshift mutations. The invention also relates to a method of detecting a polymorphic site in a nucleic acid and a method of detecting polymorphic site; antibodies raised cagainst such peptides containing polymorphic sites, antibodies raised against such peptides using the antibodies. The nucleic acids are useful for proteins/peptides using the antibodies. The nucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence of polymorphism. Such treatment would comprise administration of the wild-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                    Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; dis.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human
                                                                                           The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone MdIIO9 which contains the repeat sequence is from the marker clone MdIIO9 which contains the repeat sequence leftom formula: GGGAAATAGG (CA)18. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences which contain single nucleotide polymorphisms (SNRs). Sequences 1 to 1112 AAA76318-A77429) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 1113 to 1192 (AAA7430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the sequences 1113 to 128 (AAA77449-B1828). The SNPs in the sequences 1113 to 1128 (AAA77445) lead to conservative amino acid sequences 1129 to 1186 (AAA77446-A77503) result in non-conservative changes. The SNPs in sequences 1187 to 1192 (AAA77504-A77509) generate frameshift mutations. The invention also relates to a method of determining the relatedness of two nucleic acid and a method of determining the relatedness of two nucleic acids It also
                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism.
genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf69 which contains the repeat sequence is from formula: (AC)18.5A(AC)3. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                  Gaps

encompasses peptides containing polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic proteins/peptides using the antibodies. The nucleic actids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence bypymorphism. Such treatment would comprise administration of the wild-type nucleic acid sequence. Antibodies raised against polymorphic peptides can also be used in the treatment of such individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dY) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf1 which contains the repeat sequence as from the marker clone Mdf1 which contains the repeat sequence having the formula: CATA(CA)19. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
constant an (AF)15 and an (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
clones cross-hybridised. Assuming independent distribution of
constant and MboI sites, the frequency of (T6)n >9 microsatellites
constant and of the microsatellites is summarised in the
specification and indexed herein (see below). The sequence information
constream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
constantly individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
conomically important traits esp. in cattle, to allow selective
conomically see also AAQ33501-34437. (Updated on 25-WAR-2001 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of concaining the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clone where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdfil which contains the repeat sequence is from the marker clone Mdfil which contains the repeat sequence having the formula: (AC)23A. (Updated on 25-MAR-2003 to correct PF field.)

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of Genetic disease, commercial animal or plant breeding or pedigree analysis of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf14 which contains the repeat sequence is from formula: (AC)23A. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers pecifically priming and allowing amplification of each Vbeta gene, vbetaRNA or CDNA. The kit is useful for diagnosing organ transplant respection and diagnosing and treating T-cell associated diseases including autoimmune disease, degenerative nervous system diseases, infectious diseases arophic gastritis. Degenerative nervous system diseases include multiple arrophic gastritis. Degenerative nervous system diseases include multiple arrophic gastritis begenerative nervous system diseases include multiple arrophic gastritis. Degenerative nervous system diseases include multiple in hypersensitivities such as those include and propersensitivities such as those of allergies. Type II hypersensitivities such as those present in allergies. Type II hypersensitivities such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include as those caused by Mycobacterium. Neoplastic diseases include as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                   Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                               The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 by primers APIG579-T66047. Those clones where the repeat sequence has been determined are shown in AAJ65704-797. This repeat begat sequence is from the marker clone Mdf59 which contains the repeat sequence is from the marker clone Mdf59 which contains the repeat sequence is from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hypersensitivity disease; infectious disease; neoplastic disease; hypersensitivity disease; infectious disease; neoplastic disease; hypersensitivity disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity; Goodpasture's syndrome; type II hypersensitivity; Goodpasture's syndrome; type II hypersensitivity; parasitic infection; disease; viral infection; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;
                                                                                                                                                                                                                                          Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          formula: (AC)23.5.                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                셤
                                                                                                                                  The sequence is a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 clones cross-chybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for garentsge testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The repeats, when
                                                                                                                                                                                 The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Mdf50 which contains the repeat sequence is from the marker clone Md50 which contains the repeat sequence is from the marker clone Md50 which contains the repeat sequence is from the marker clone Md50 which contains the repeat sequence is from the marker clone Md50 which contains the repeat sequence is from the marker clone which contains the repeat sequence is from the marker clone which contains the contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

```
analysed, fall into 4 categories: 1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent repeats of another sequence; 2) imperfect repeats which are defined as 2 or more runs of uninterrupted CA repeats separated by no more than 3 consecutive non-repeat bases; 3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least 5 uninterrupted dinucleotide or longer repeats of a sequence other than (dC-dA)n. (dG-dT)n, or from at least 10 uninterrupted monomucleotides; and 4) imperfect compound repeats which are defined as for the perfect compound repeats except that the runs of CA are interrupted. The sequence presented here is an example of a perfect repeat sequence of structure: (AC)19. (Updated on 25-MAR-2003

The present invention describes a method (MI) for selecting a domestic animal for having desired genotypic properties. The method comprises testing the animal for the presence of a parentally imprinted quantitative trait locus (QTL). The pig QTL is located at chromosome 2, mapping at around position 2pl.7. Also described are: (1) an isolated and/or recombinant nucleic acid (NI) comprising a parentally imprinted QTL or its functional fragment; (2) an isolated and/or recombinant nucleic acid (N2) constraing a synthetic parentally imprinted QTL or its functional fragment; (3) an isolated from at least one chromosome or its functional fragment; (3) an animal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition [LASA] assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, thuntington's disease, or muscular dystrophy. Purthermore, the method may be used for identifying and/or typhna microorganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic
such as pig selected for having desired genotypic or potential phenotypic properties, (4) a transgenic animal comprising NI or N2; and (5) sperm or an embryo derived from the animal of (3) or (4). NI or its fragment is useful for selecting an animal destined for slaughter or a breeding
                                                                           animal having desired genotypic or potential phenotypic properties. The properties are related to muscle mass and/or fat deposition. The sperm or an embryo are useful in breeding animals destined for slaughter. The
                                                                                                                                        present sequence represents a microsatellite oligonucleotide, which is given in an example from the present invention for the identification of DNA sequence polymorphisms in the IGF2 (insulin-like growth factor 2) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Microsatellite; ligase-assisted spacer addition assay; LASA; cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.

microorganisms, and for genotyping subjects including humans. The method cost is also useful for detecting certain cancers and other malignancies.

Moreover, the method can be used to provide markers for use in identification of human and non-human individuals, plants and comitor responses to therapies including the possibility of and to monitor responses to therapies including the possibility of concleic acid damage. The nucleotide polymorphisms may be used in forensic concleic acid damage. The nucleotide polymorphisms may be used in forensic crime, in gene mapping and population studies. LASA may also be used in the mannifecture of a fit for detecting and/or identifying nucleotide crime, in gene mapping and population studies. LASA may also be used in the LASA method avoids the time and cost required by prior art comme. The LASA method avoids the time and cost required by prior art commence using agel electrophoresis and Southern transfer analysis. In the use of gel electrophoresis a process that has proved difficult to the use of gel electrophoresis a process that has proved difficult to the use of gel electrophoresis and southers avoidance of this attong candidate for future use in clinical and laboratory procedures. for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective by receding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

```

field.)

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol eites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information

Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 olds overlected by probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites on the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The constream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The sequence of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of Genetic disease, commercial expeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 by primers AAT65798-T66047. Those clones where the repeat sequence is from the marker clone Md£29 which contains the repeat sequence is from the marker clone Md£29 which contains the repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of polymorphic genetic markers of the form (dG-dA)n(dG-dT)n-using novel nucleic acid mols. as primers.

```
The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine Mbol DNA fragments of between 250 and 500

CC bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

CC ob with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

CC ones cross-hybridised. Assuming independent distribution of 50

CC or an expectabilities and Mbol sites, the frequency of (TG)n >9 microsatellites

CC or a. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence supstream and specification and indexed herein (see below). The sequences upstream and commerce of the microsatellite sequence were used to generate the commerce of in vitro amplification of the corresp.

CC microsatellite (using the program OPTIRRIM). The microsatellites may be microsatellite supplied to identify individuals, for parentage testing, and in the genetic companion of economically important traits esp. in cattle, to allow selective fired in the correct of the corre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial cannal or plant breeding or pedigree analysis. The repeats, when analysed, fall into 4 categories: 1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent or more runs of uninterrupted CA repeats separated by no more than 3 consecutive non-repeat bases; 3) compound perfect repeats which are defined as 2 consecutive non-repeat bases; 3) compound perfect repeats which are consecutive non-repeat bases; 5 uninterrupted dinuclectide or repeat bases from a run of at least 5 uninterrupted dinuclectide or longer repeats of a sequence other than (dC-dA)n.(dG-dA)n, or from at least 10 uninterrupted mononuclectides; and 4) imperfect compound repeats which are defined as for the perfect compound repeats except that the runs of CA are interrupted. The sequence presented here is an example of the perfect repeats sequence of structure: (CA)20. (Updated on 25-MAR-2003)

markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT55798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone MdE23 which contains the repeat sequence is from formula: (AC)20. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                        The invention relates to the isolation of polymorphic repeat sequences can having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human command or plant breeding or paternity or malysis. The repeats, commercial animal or plant breeding or pedigree analysis. The repeats, when can alysed, fall into 4 categories: 1) perfect repeats which are alacentaring tandem CA repeats with no interruptions and without adjacent crepeats of another sequence; 2) imperfect repeats which are defined as 2 cor more runs of uninterrupted CA repeats separated by no more than 3 consecutive non-repeat bases; 3) compound perfect repeats which are consecutive non-repeat bases; 2) imperfect repeat bases from a run of at least 5 uninterrupted dinucleotide or crepeat bases from a run of at least 5 uninterrupted dinucleotide or clonger repeats of a sequence other than (dC-dA)n. (dG-dT)n, or from at least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats compound repeats control or from a consecutive or the perfect compound repeats except that the consecutive or the perfect compound repeats except that the consecutive or the perfect compound repeats an example of a perfect repeat sequence of structure; (AC)20. ```
The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements core corrected for amplifying an SSR, identifying (M1) an SSR by preparing a suitable for amplifying an SSR, identifying (M1) an SSR by preparing a corrected former in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs and and in the library containing SSRs, a library of ryegrass identifying clones in the library containing SSRs, a library of ryegrass or rereal breeding by identifying an SSR that is closely a speciated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a preferentially co-inherited, and selecting for the SSR in the breeding, and the differential species varieties by assessing method for DNA profiling grass or cereal species varieties or cereal breeding, for may be used in the selection of genes in grass or cereal breeding, for may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the corrected string the purity of grass or cereal seed batches, and for DNA profiling to establish the selection of for DNA profiling to establish the selection of for DNA profiling to establish the sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Microsatellite, ligase-assisted spacer addition assay; LASA; cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, Huntington's disease, or muscular dystrophy. Purthermore, the method may be used for identifying and/or typing microorganisms; including yeasts and lower uni- and multi-cellular organisms. Purthermore, the method may be used to genotyping subjects including humans. The method is also useful for detecting certain cancers and other malignancies.

Moreover, the method can be used to provide markers for use in identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and concernance of a identification of human and non-human individuals, plants and concernance of a crime, in gene mapping and population studies. LASA may also be used in the manufacture of a kit for detecting and/or identifying nucleotide crime, in gene mapping and population studies. LASA may also be used in the menthods using gel electrophoresis and Southern transfer analysis. In particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to automate or miniaturies. The LASA method allows total avoidance of this mainiaturies and shorehor transfer analysis. In the use of gel electrophoresis, a process that has proved difficult to automate or miniaturies. The LASA method allows total avoidance of this and laboratory procedures. Aska method allows total avoidance of this and laboratory procedures. Aska detection seconds and laboratory procedures. Process that
                                                  Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligaseassisted spacer addition assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        detect polymorphisms or microsatellites as described in the method of

```
The invention relates to the isolation of polymorphic repeat sequences markers. Primers based on these sequences can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AATGS798-166047. Those clones where the repeat sequence has been determined are shown in AATGS704-797. This repeat sequence has the marker clone Mdf8 which contains the repeat sequence is from the marker clone Mdf8 which contains the repeat sequence is from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                         ö
                                                                              The invention relates to the isolation of polymorphic repeat sequences having the sequence (dG-dA)n.(dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dG-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf45 which contains the repeat sequence is from the marker clone Mdf45 which contains the repeat sequence having the formula: (CA)20.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n.(dG-dT)n which can be used as genetic markers. Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dr) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf63 which contains the repeat sequence is from the marker clone Mdf63 which contains the repeat sequence having the formula: (CA)20.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; T-cell associated disease; Vbeta; autoimmune disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infectious disease; neoplastic disease; Addison's disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity; disease; type I hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; defectious disease; viral infection; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoporoliferative disease; leukaemia; lymphoma; cancer; brain cancer;

CC rejection and diagnosing and treating T-cell associated diseases
including autoimmune diseases, degenerative nervous system diseases,
including autoimmune diseases, degenerative nervous system diseases,
craft versus host disease, hypersensitivity diseases, infectious diseases,
and neoplastic diseases. Autoimmune diseases include Addison's disease,
atrophic gastritis. Degenerative nervous system diseases include multiple
catrophic gastritis. Degenerative nervous system diseases include multiple
catrophic gastrities us as contact with allergens that lead to
allergies, Type II hypersensitivities such as those present in
Caodpasture's syndrome and Type IV hypersensitivities such as those
caused by viruses such as HIV, fungal infections such as those caused by
the yeast genus Candida, parasitic infections such as those caused by
schistosomes, filaria and bacterial infections such as those caused by
Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
such as leukaemias, lymphomas and cancers such as cancer of the brain,
breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bow with an (AC)15 and a (TC)15 oligonucleocide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65794-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf62 which contains the repeat sequence is from the marker clone Mdf62 which contains the repeat sequence is from the marker clone Mdf62 which contains the repeat sequence is from the marker clone Mdf62 which contains the repeat sequence having the formula: (AC)21. (Updated on 25-MAR-2003 to correct PF field.)
required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective bisecoing. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

The invention relates to a substantially purified or isolated mucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements or from ryegrass or more tandemly repeated nucleotide core elements or suitable for amplifying an SSR, identifying (M1) an SSR by preparing a suitable for amplifying an SSR, identifying (M1) an SSR by preparing a cantishe for amplifying an SSR, identifying SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs and core elements or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely conferentially co-inherited, and selecting for the SSR in the breeding, a preferentially co-inherited, and selecting for the SSR in the breeding, and core conference of preferentially co-inherites and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs can be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the calenty of distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species

The invention relates to a method of identifying or detecting a mucleotide repeat region in a nucleic acid molecule characterised by a mucleotide repeat region in a nucleic acid molecule characterised by a comprising employing ligase-assisted spacer addition classes. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a nucleotide length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, a useciated with a neurodegenerative disease including fragile X syndrome, be used for identifying and/or typing microorganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic microorganisms; and for genocyping subjects including humans. The method can be used to provide markers for use in Moreover, the method can be used to provide markers for use in identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and microorganisms, to ascertain parentage of human or non-human individual, crime, in gene mapping and population studies including the possibility of science to identify a particular victim or an alleged perpetrator of a crime, in gene mapping and population studies. LASA may also be used in the manufacture of a kit for detecting and/or identifying nucleotide crime and complement and southern transfer analysis. In methods using gelelectrophoresis and Southern transfer analysis. In methods using gelelectrophoresis and southern transfer analysis. In particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-
                                                                                                                                                                                                                                                                                                                                                                                         Microsatellite, ligase-assisted spacer addition assay; LASA; cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.

Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-777. This repeat sequence has the marker clone Mdf123 which contains the repeat sequence listrom the marker clone Mdf123 which contains the repeat sequence listrom formula: (AC)21.5. (Updated on 25-MAR-2003 to correct PF field.)
automate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n-using novel nucleic acid mols. as primers.

One out of 50 close cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information appecification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

In section and individuals, for parentage testing, and in the genetic mapping of conomic trait loci, or genes involved the determinism of breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

screening a library of bovine Mool DNA fragments of between 250 and 500
creening a library of bovine Mool DNA fragments of between 250 and 500
compared by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mool sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
cfor ca. 210 such bovine microsatellites is summarised in the
specification and indexed horein (see below). The sequences upstream and
downstream of the microsatellite sequence were used to generate the
crequired PCR primers for in vitro amplification of the corresp.
microsatellite (using the program opripring). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
cmapping of economic trait los; or genes involved the determinism of
economically important traite esp. in cattle, to allow selective
ceconomically important traite sp. in cattle, to allow selective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (GC-dA). (GG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-766047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf49 which contains the repeat sequence is from the marker clone Mdf49 which contains the repeat sequence is from formula: (CA)22. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligase-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Microsatellite; ligase-assisted spacer addition assay; LASA; cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.
Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.
                                                                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these
                                                                                                                                                                                                                                                                                                                                                                               DB 1; Length 44;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ሯ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                 The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-707. This repeat sequence is from the marker clone Mdf66 which contains the repeat sequence is from the marker clone Mdf66 which contains the repeat sequence is from formula: (AC)22. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                               Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n-using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

cc nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is cassociated with a neurodegenerative disease including fragile X syndrome, thurtington's disease, or muscular dystrophy. Furthermore, the method may be used for identifying and/or typing microorganisms including yeasts and construction of the method can be used to recorganisms including yeasts and microorganisms; as well as prokaryotic microorganisms; and for genotyping subjects including humans. The method can be used to provide markers for use in microorganisms, to ascertain cancers and other malignancies. Moreover, the method can be used to provide markers for use in microorganisms, to ascertain parentage of human or non-human individual, and to monitor responses to therapies including the possibility of crime, in gene mapping and population studies. Lash may be used in forensic conclence to identify a particular victim or an alleged perpetrator of a crime, in gene mapping and population studies. Lash may also be used in the manufacture of a kit for detecting and/or identifying nucleotide repeat regions such as a nucleotide length polymorphism in a eukaryotic repeat regions uch as a nucleotide length polymorphism in a eukaryotic repeat regions uch as a nucleotide length polymorphism in a cukaryotic genome. The Lash method avoids the time and cost required by prior art methods using gel electrophoresis and southern transfer analysis. In particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to the use of gel electrophoresis mand shallows total avoidance of this automate or miniaturise. The Lash method allows total avoidance of this caucomate or miniaturise. The Lash method allows total avoidance of this caucomate or miniaturise. The Lash method allows the particular propression of the particular procession of the

Table 7; Page 295; 517pp; English. mapping, and selective breeding.

```
The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine Mbo! DNA fragments of between 250 and 500

CC clones cross-hybridised. Assuming independent distribution of

CC clones cross-hybridised. Assuming independent distribution of

CC microsatellites and Mbo! sites, the frequency of (T6)n >9 microsatellites

CC in the bovine genome is estimated at >100,000. The sequence information

CC for ca. 230 such bovine microsatellites is summarised in the

CC specification and indexed herein (see below). The sequences upstream and

CC downstream of the microsatellite sequence ware used to generate the

CC microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

CC used to identify individuals, for parentage teating, and in the genetic

CC mapping of economic trait loc; or genes involved the determinism of

CC contract DAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

CC breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 210 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC1)5 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information consistent of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The equired PCR primers for in vitro amplification of the corresp.

The country individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           by with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primors for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used to detect these narkers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those clones where the repeat sequence has by primers AAT65794-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the repeat sequence is from the marker clone Mdf17 which contains the marker clone which marker clone wh
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AMF65798-f6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf61 which contains the repeat sequence is from the marker clone Mdf61 which contains the repeat sequence having the formula: (CA)23. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Glones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from
                                                                                                                                                                                                                                                     Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the marker clone Mdf7 which contains the repeat sequence having the formula: (CA)20TA(CA)2. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 46 BP; 23 A; 22 C; 0 G; 1 T; 0 U; 0 Other;

Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligaseassisted spacer addition assay.

Example 10; Page 55; 89pp; English.

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a particular length. In particular, the method is useful for identification of a mucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, Huntington's disease, or muscular dystrophy. Furthermore, the method may consist and for genotyping subjects including humans. The method lower uni- and multi-cellular organisms, as well as prokaryotic microorganisms; and for genotyping subjects including humans. The method can be used to provide markers for useful for detecting certain cancers and other malignancies. Moreover, the method can be used to provide markers for use in cleantification of human and non-human individuals, plants and microorganisms, to ascertain parentage of human or non-human individual, and to concert responses to therapies including the possibility of conclor responses to therapies including the possibility of crime, in gene mapping and population studies. LASA may also be used in the manufacture of a kit for detecting or an alleged perpetrator of a crime, in gene mapping and population studies. LASA method avoide the time and cost required by the creating crepts and cost required by an electrical and cost required by an electrical and cost required by the an autocotical and cost required by an electrical particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to attomate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABX4376-ABX4313 represent primers used to detect polymorphisms or microsatellites as described in the method of the methods using gel electrophoresis and Southern transfer analysis. In nvention

Human Vbeta gene repeat sequence #371.

human; T-cell associated disease; Wheta; autoimmune disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infections disease; neoplastic disease; Addison's disease; atrophic gastritis; Addison's disease; atrophic gastritis; Alzelemer's disease; hypersensitivity disease; type I hypersensitivity doodpasture's syndrome; type II hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; doodpasture's syndrome; type IV hypersensitivity; dections disease; viral infection; filaria; bacterial infection, Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;

breast cancer; ds.

Homo sapiens

```
The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each 'Ubera gene, 'DetaRNA or cDNA. The kit is useful for diagnosing organ transplant completed and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, and neoplastic diseases, hyperenativity diseases, infectious disease, and neoplastic diseases, Autoimmune diseases include Addison's disease, arrophic gastritis. Degenerative nervous system diseases include multiple strophic gastritis and Alzheimer's disease. Hypersensitivity diseases include Type in hypersensitivities such as chose present in C doodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as Those caused by viruses such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and pacterial infections such as those caused by contacterium Neoplastic diseases include any paper.
                                                                                                                                                                                                                                                                                                                                                                                         Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-da)n. (dg-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Gnes containing the animal or plant breeding or pedigree analysis. Octaming the phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdflis which contains the repeat sequence is from the marker clone Mdflis which contains the repeat sequence having the formula: ATAGGAGAG(AC)17.5. having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e-g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704-737. This repeat sequence has the marker clone Mdf9 which contains the repeat sequence is from the marker clone Mdf9 which contains the repeat sequence having the formula: (CA)17G. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n-using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                    The invention relates to the isolation of polymorphic repeat sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 35 BP; 17 A; 17 C; 1 G; 0 T; 0 U; 0 Other;

New isolated CYP3A4 polymorphic sequences.

Claim 2; Page 35; 40pp; English

This sequence represents a CYP3A4 sequence polymorphism of the invention, which is part of a non-naturally occurring chromosome. Nucleic acids comprising the CYP3A4 polymorphic sequences can be used to screen patients for altered metabolism for CYP3A4 substrates, potential drug-drug interactions, and adverse/side effects as well as diseases that result from environmental or occupational exposure to toxins. They can also be used to establish animal, cell culture and in vitro cell-free models for drug metabolism. Polymorphic CYP3A4 gene sequences can be used for expression studies to determine the effect of promoter and/or intron sequence variations on mRNA expression and stability. The polymorphisms

```
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
downstream of the microsatellite sequence water used to generate the
required PCR primers for in vitro amplification of the corresp.
incrosatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                     ö
are also used as single nucleotide polymorphisms to detect genetic linkage to phenotypic variation in activity and expression of CYP3A4. The nucleic acids can also be used to generate genetically modified non-human animals or site specific gene modifications in cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleocide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information specification and indexed herein (see below). The sequence information specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information specification and indexed herain (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primars for in vitro amplification of the corresp. microsatellite (using the program OPTIPRM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trail loci, or genes involved the determinism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           economically important traits esp. in cattle, to allow selective breeding. screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
con the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comparisem of the microsatellite sequence ware used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
first.
